

TransitionManager Insight

Gain a consolidated view of your IT estate data

AT A GLANCE

TransitionManager Insight provides a consolidated and trusted source of truth for all your IT estate data.

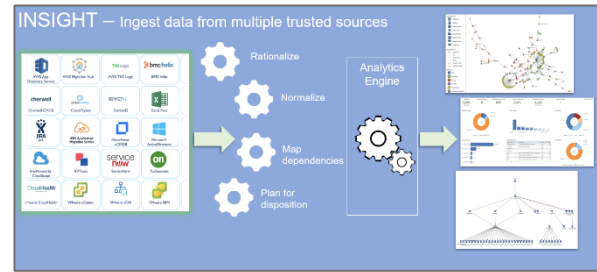

KEY BENEFITS

- Integrate all critical data you need from sources such as CMDBs, DCIM, ITSM ops and auto discovery tools.
- Act with data that is fresh, normalized, and prioritized.
- Give a consistent view of data for all stakeholders with unlimited users.
- Migrate and modernize applications quickly and securely.
- Execute large scale migrations on thousands of workloads.

TransitionManager Insight has proven to help customers fully discover their environment 50% faster than with traditional methods.

Business Challenge

Enterprises are developing transformation strategies, but siloed approaches to decision making and incongruous tools create a lack of understanding or consensus on how to achieve desired outcomes. These conditions make timely and informed decision-making difficult.

To make better decisions, enterprises need a single tool and language that all stakeholders use to communicate and understand the complete IT estate. They also need to aggregate data from multiple sources and collaborate across the organization.

Crucial components of every transformation journey include understanding dependencies between applications and infrastructure, budget and timeline, and lifecycle and disposition.

The Solution

TransitionManager Insight is a purpose-built tool that provides visibility and analytics to the exact questions that enterprises encounter on their transformation journey. It includes color-coded and environment-specific dependency maps, an analytics engine with countless filtering options, and APIs to many of the industry's leading CMDBs and other commonly used tool sets. TransitionManager Insight can be used to evaluate challenges and opportunities for applications, IT infrastructure, networks, and platforms.

Most importantly, TransitionManager Insight provides a common platform for disparate groups to agree on and collaborate on their transformation journey.

Achieving Detailed Dependency Analysis

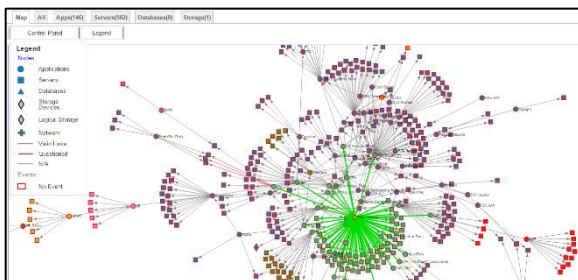

Global partners and customers utilize TransitionManager Insight to accurately discover and validate customer environments in conjunction with other assessment tools such as Aria Operations for Networks, Cloudamize and AWS Application Migration Service.

Combining this data into the TransitionManager platform, Insight becomes the foundation by which all decisions regarding a customer's IT modernization strategy are made.

Data ingestion is automated using API and human interactions to enhance accuracy and assure data quality. With a readiness assessment and both current and target environments evaluated, Insight creates an inventory and validates the application landscape and associated server, database, storage, and network dependencies.

Customers now have a consolidated view of all IT assets and their relationships – achieving the coveted, single source of truth for their data.

Once data is gathered and aggregated, TransitionManager Insight provides dependency analysis and groups all servers and applications to expose critical dependencies. With various stakeholders in mind, results from dependency analysis are parsed into various types of views and summarized by application, network and sorted by disposition status.

Dependency Analyzer

Benefits

Proven methodology using TransitionManager Insight efficiently validates the application landscape and associated server, database, storage, and network dependencies, so customers can execute IT modernization projects, and migrations, accurately and with minimal disruption.
